

Claude QA Response

INPUT — Prompt

Role: You are a senior software QA engineer.

Context: We are testing a simple login page. It has:

- A username field (accepts email format)
- A password field (min 8 characters)
- A "Login" button
- A "Forgot Password" link

Instruction: Generate 8 test cases for this login page.

Constraints: Include at least 2 negative test cases and 1 boundary value test case.

Output Format: Return as a numbered list with:

Test ID | Test Case Name | Steps | Expected Result

OUTPUT — Generated Test Cases

1. TC-001 — Valid Login – Positive **[Positive]**

Steps: Enter a valid email (user@example.com) and password (≥8 chars) → Click Login

Expected Result: User is authenticated and redirected to the home/dashboard page

2. TC-002 — Invalid Email Format – Negative **[Negative]**

Steps: Enter a malformed email (userexample.com or user@) and any password → Click Login

Expected Result: Inline validation error: 'Please enter a valid email address'; login is blocked

3. TC-003 — Wrong Password – Negative **[Negative]**

Steps: Enter a valid registered email and an incorrect password → Click Login

Expected Result: Error message: 'Invalid credentials'; no hint about which field is wrong (security best practice)

4. TC-004 — Password at Boundary – Exactly 8 Characters **[Boundary]**

Steps: Enter a valid email and a password of exactly 8 characters → Click Login

Expected Result: Login proceeds normally; 8-char password is accepted as the minimum valid length

5. TC-005 — Password Below Boundary – 7 Characters **[Boundary / Negative]**

Steps: Enter a valid email and a 7-character password → Click Login

Expected Result: Validation error: 'Password must be at least 8 characters'; login is blocked

6. TC-006 — Empty Fields Submission – Negative [Negative]

Steps: Leave both username and password fields blank → Click Login

Expected Result: Both fields show required-field validation errors; form is not submitted

7. TC-007 — Forgot Password Link Navigation [Positive]

Steps: Click the Forgot Password link on the login page

Expected Result: User is redirected to the password recovery page; a mechanism to reset via registered email is presented

8. TC-008 — SQL Injection Attempt in Email Field [Security / Negative]

Steps: Enter ' OR '1'='1 in the email field and any string in the password → Click Login

Expected Result: Input is sanitized; login fails with a generic error; no DB error or unintended access occurs

Notes: TC-003 avoids field-specific error messages to prevent security leaks. TC-008 is a minimal sanity check — a full security suite would also cover XSS payloads, brute-force lockout thresholds, and HTTPS enforcement.
